PURPOSE

This water analysis is intended to assist in properly sizing the domestic transmission and distribution system for the Greenbriar Property. This analysis will confirm that the proposed water lines will be sized appropriately to meet or exceed the City of Sacramento's Water Distribution System Design Criteria.

STUDY AREA

Greenbriar is located within the North Natomas Vision Area and is currently outside the Sacramento City Limits. Request for annexation into the City is currently being processed. Greenbriar is located directly west of Highway 99 and north of Interstate 5. The development encompasses approximately 577 acres. The purpose of this study is to adequately size the transmission and distribution mains within the Greenbriar development. Land use for the Plan Area will consist of low, medium and high density residential, elementary school, parks, and commercially zoned properties. The existing land use consists of open agricultural fields with relatively gentle slopes.

Refer to **Figure 1** for the project location.

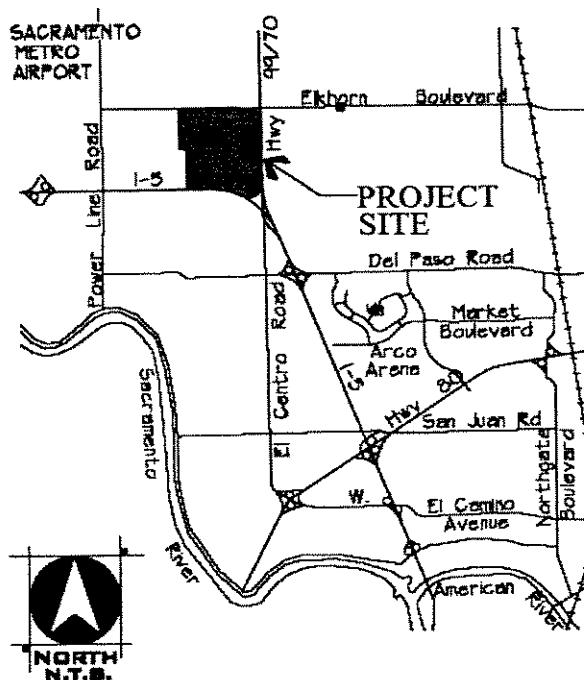

Figure 1 - Location Map.

ASSUMPTIONS

Assumptions used for this analysis are based on the proposed land use plan dated April 4, 2005 by Wood Rodgers, Inc.; the City of Sacramento's Department of Utilities staff; and the City of Sacramento's Water Distribution System Design Criteria.

Land Use

The Greenbriar development is proposed to consist of:

- 1,146 low density residential lots.
- 1,565 medium density residential lots.
- 1,012 high density residential lots.
- 26 acres of commercial.
- 49 acres of parks.

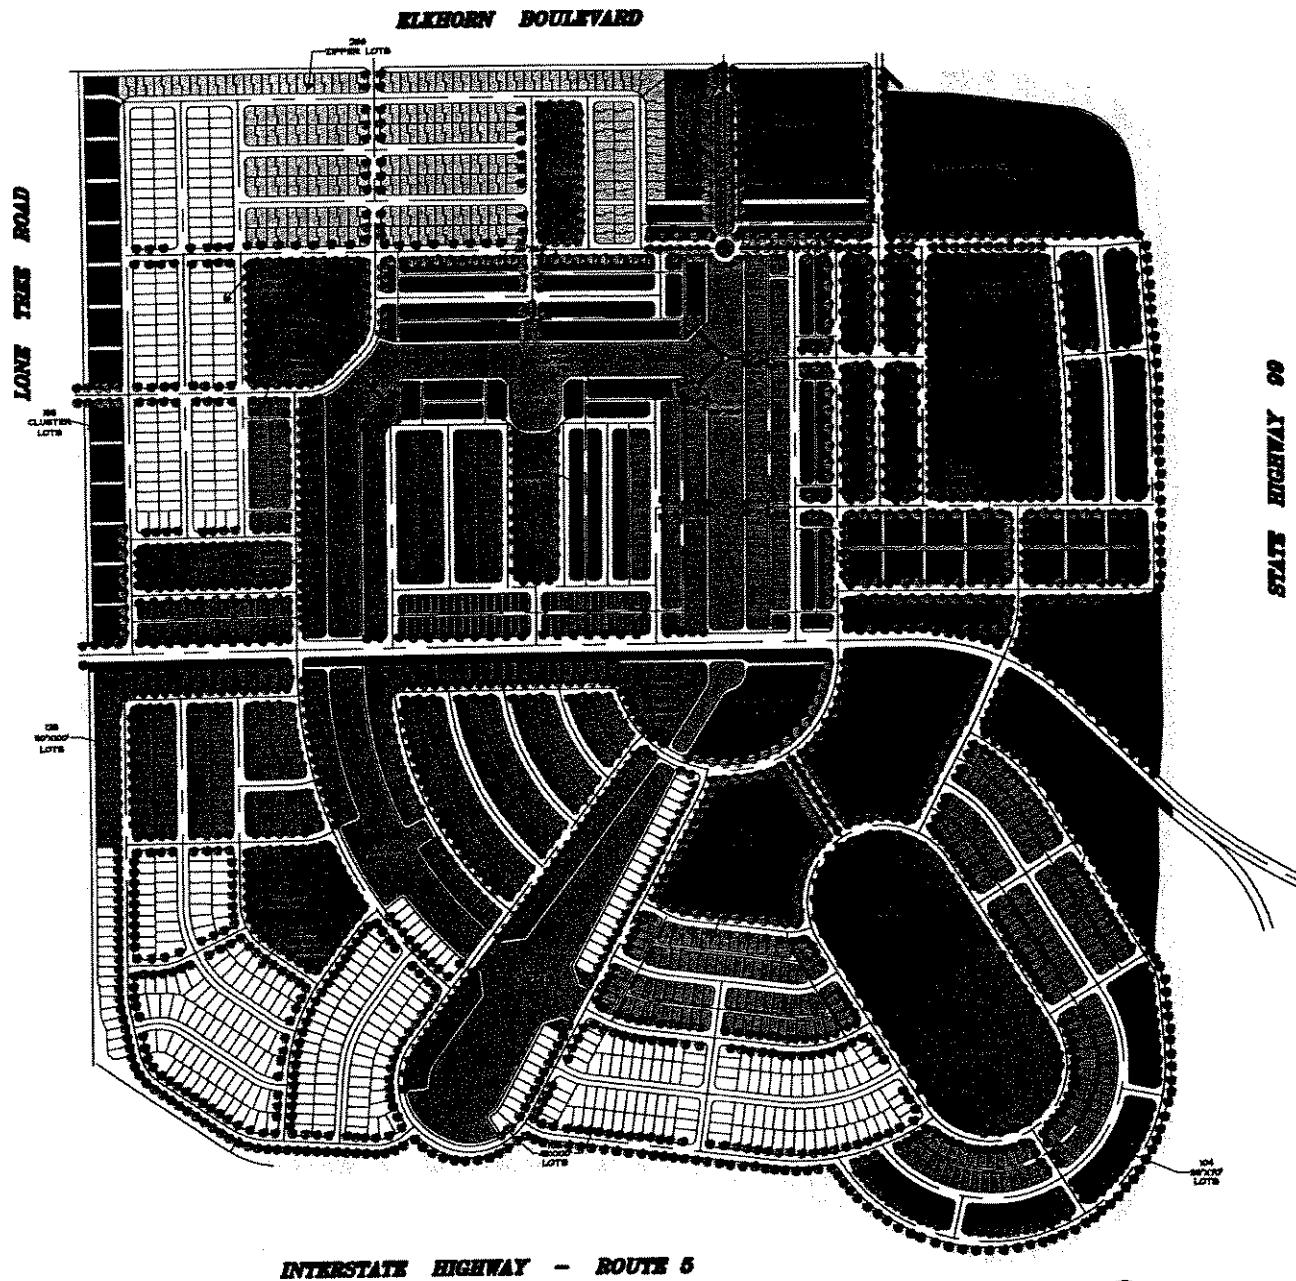

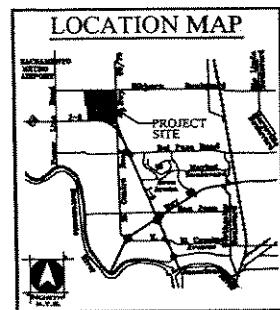

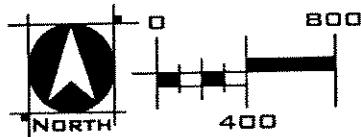

Figure 2 shows the proposed land use plan for Greenbriar.

JULY 2005

Demand and Peaking Factors

The City's Water Distribution System Criteria were used to determine the proposed water use demands in the model. Peaking factors were used to simulate system-operating scenarios for the water distribution system analysis. Maximum Day Demands (MDD) were developed by applying a MDD factor of 1.8 to the Average Day Demand (ADD) estimates. The Peak Hour Demands (PHD) were developed by applying a PHD factor of 1.3 to the Maximum Day Demands (MDD). The demands were increased by 7.5% to account for system losses per City criteria. **Table 1** shows the ADD, MDD, and PHD used for the hydraulic modeling scenarios. Refer to Appendix A for complete demand projections.

Table 1 - Potable Water Demand Projections for Greenbriar.

Land Use Designation	Total		ADD Unit Water Demand		Demand (gpm)		
	Acre* (net)	Dwelling Units	gpm/ac	gpm/du	ADD	MDD	PHD
Low Density Residential	128	1,146	---	0.44	504	907	1179
Medium Density Residential	106	1,565	---	0.44	689	1240	1612
High Density Residential	45	1,012	2.48	---	112	202	262
Commercial	26	---	1.86	---	48	86	112
Parks/Landscape	84	---	2.60	---	217	391	508
Schools	10	---	1.55	---	16	29	37
Subtotal	399	3723			1586	2855	3711
7.5% System Losses					119	214	278
Totals					1705	3069	3989

*Acreage does not include street right of way.

Operational Requirements

The City of Sacramento has developed water distribution system design criteria to be used in the planning of new water distribution systems. These criteria apply to water studies that analyze subdivision level developments. The criteria help ensure adequate pressure and flow are available to serve customers on a daily basis and also during emergency fire situations. The criteria used in this study are listed in **Table 2**.

FIGURE 3. EXISTING DISTRIBUTION FACILITIES

GREENBRIAR CITY OF SACRAMENTO

JULY 2005

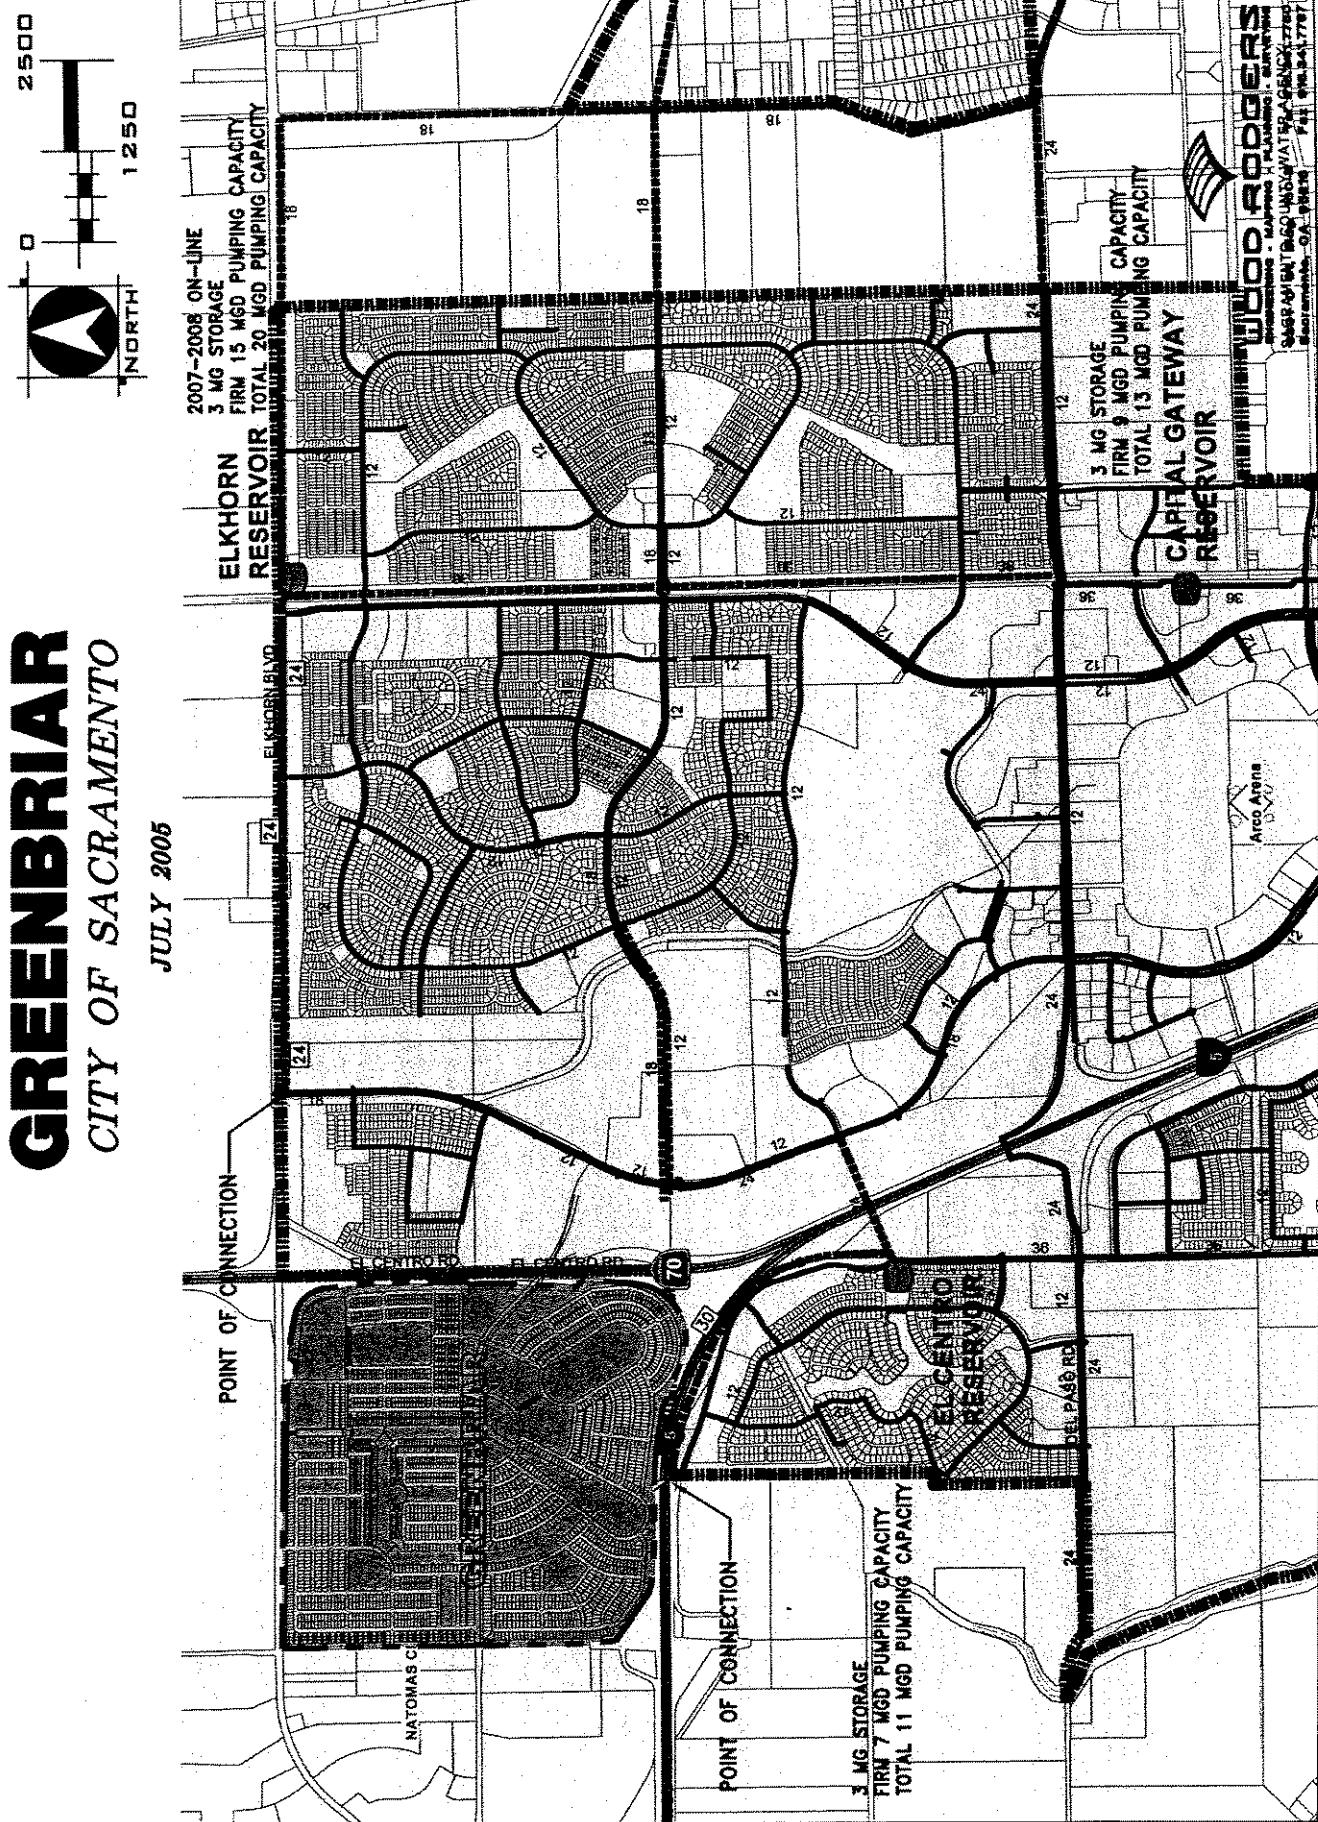

Table 3 - Boundary Conditions.

Point of Connection Location	Point of Connection ID	Hydraulic Grade Line (ft)		Pressure (psi)	
		MDD	PHD	MDD	PHD
Terminal End of Airport Connection	PUMP-105	91.4	91.2	30.1	30.0
Elkhorn Blvd and East Commerce Way	PUMP-107	96.7	95.9	30.6	30.2

SUMMARY OF ANALYSIS

The water model was developed using MWH Soft, Inc. hydraulic modeling program, H₂ONET version 6.0. An electronic copy of the water distribution model is available upon request.

The transmission and distribution system was laid out following the street centerline, creating a looped system. Pipe sizes range from 8-inch to 18-inch diameter with the larger diameter pipes looped around commercial and school sites to convey the higher fire flow requirements. Greenbriar was modeled independent of the surrounding developments. **Table 4** summarizes the model results for average day demands, maximum day demands, and peak hour demands.

Table 4 - System Hydraulic Modeling Scenario Results.

Demand Scenario	Greenbriar Demand (gpm)	Minimum System Pressure (psi)	Maximum System Velocity (fps)
Average Day	1,705	34	1.2
Maximum Day	3,069	31	2.2
Peak Hour	3,989	30	2.5

Figure 4 shows the layout of the proposed water system. A full size exhibit is located in **Appendix C**. Hardcopy results for the demand scenarios are located in **Appendix D**.

Fire Flow Results

Fire flow analyses were performed during maximum day demands. The fire flow demand requirements by land use are shown in **Table 2**. The fire flow analysis calculated the available fire flow at every required node in the system. **Table 5** lists the locations most sensitive to the fire flow demands.

Table 5 - Fire Flow Results During Maximum Day Demands.

Fire Flow Node	Required Fire Flow (gpm)	Total Plan Area Demand (gpm)	Minimum Pressure (psi)	Maximum Velocity (ft/sec)
GB-443	1,500	4,569	25	4.6
GB-313	2,000	5,069	23	5.8
GB-427	3,000	6,069	20	4.5

Hardcopy results for all scenarios are located in **Appendix D**.

CONCLUSIONS

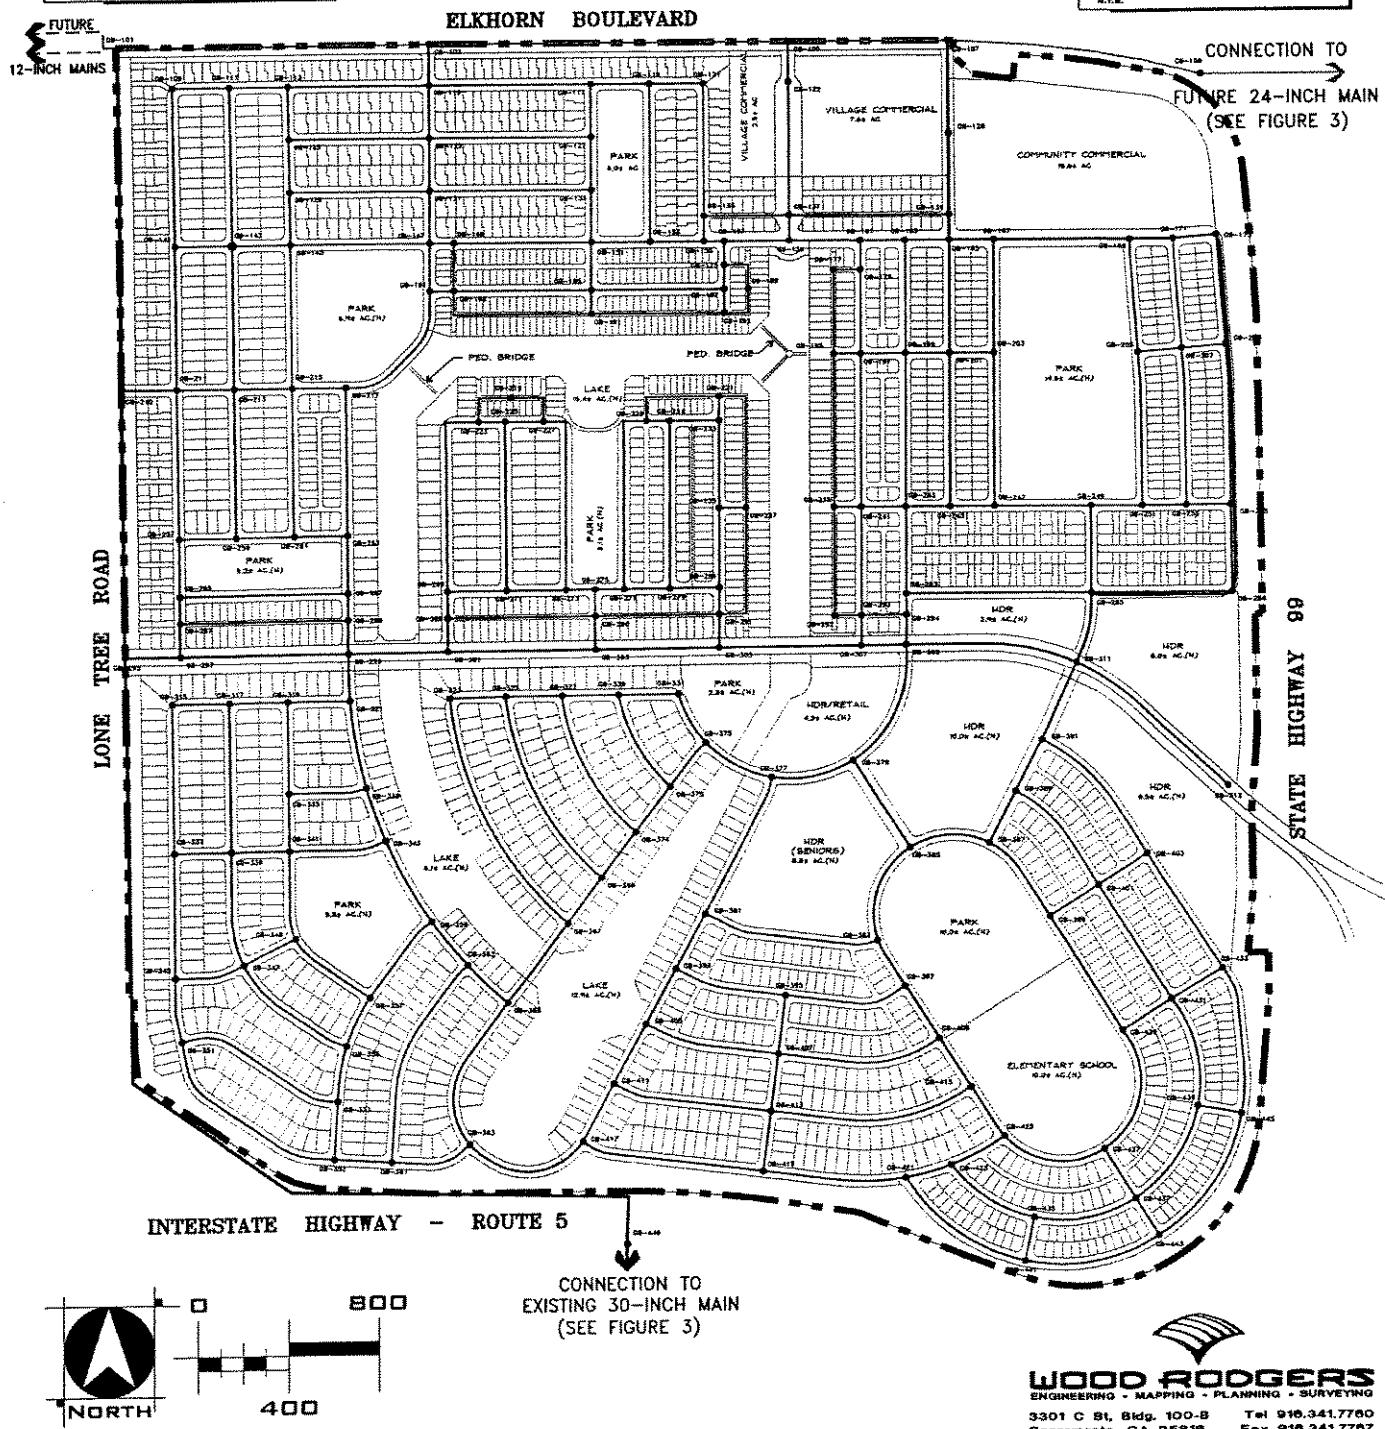

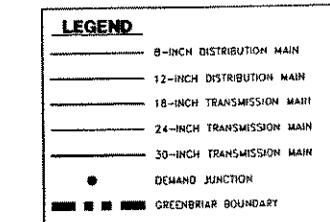

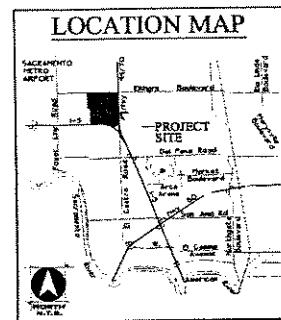

The City of Sacramento Water Distribution Design Criteria requirements were met for this water distribution system. There are several assumptions on which the hydraulic model is based. The model would require modification if any additional information becomes available that would affect the way water is delivered to the development.

MEMORANDUM

TO: Joshua Wolf, Project Engineer
FROM: Brett Ewart, Assistant Engineer
SUBJECT: **DISTRIBUTION SYSTEM BOUNDARY CONDITIONS FOR GREENBRIAR**

The GREENBRIAR project has been incorporated into the City's regional model to verify boundary conditions and fireflow capacity at three proposed connections to the existing distribution system. Please refer to the attached map and graphs for location of analysis points and associated results.

The following assumptions were incorporated into this review:

1. The developer appropriately allocated demands and required fireflow.
2. Max Day conditions were prevalent.
3. The conditioned T-main alignment of 24 & 30-inch main was added to the proposed project.

Based on these criteria, a Maximum Day Demand condition, steady state modeling analysis was performed. Three (3) hydraulic capacity curves were prepared for the proposed development to represent the general capacity of the existing system at the three connections. This assumes that the proposed development has been constructed with Max Day demands allocated by Wood Rodgers.

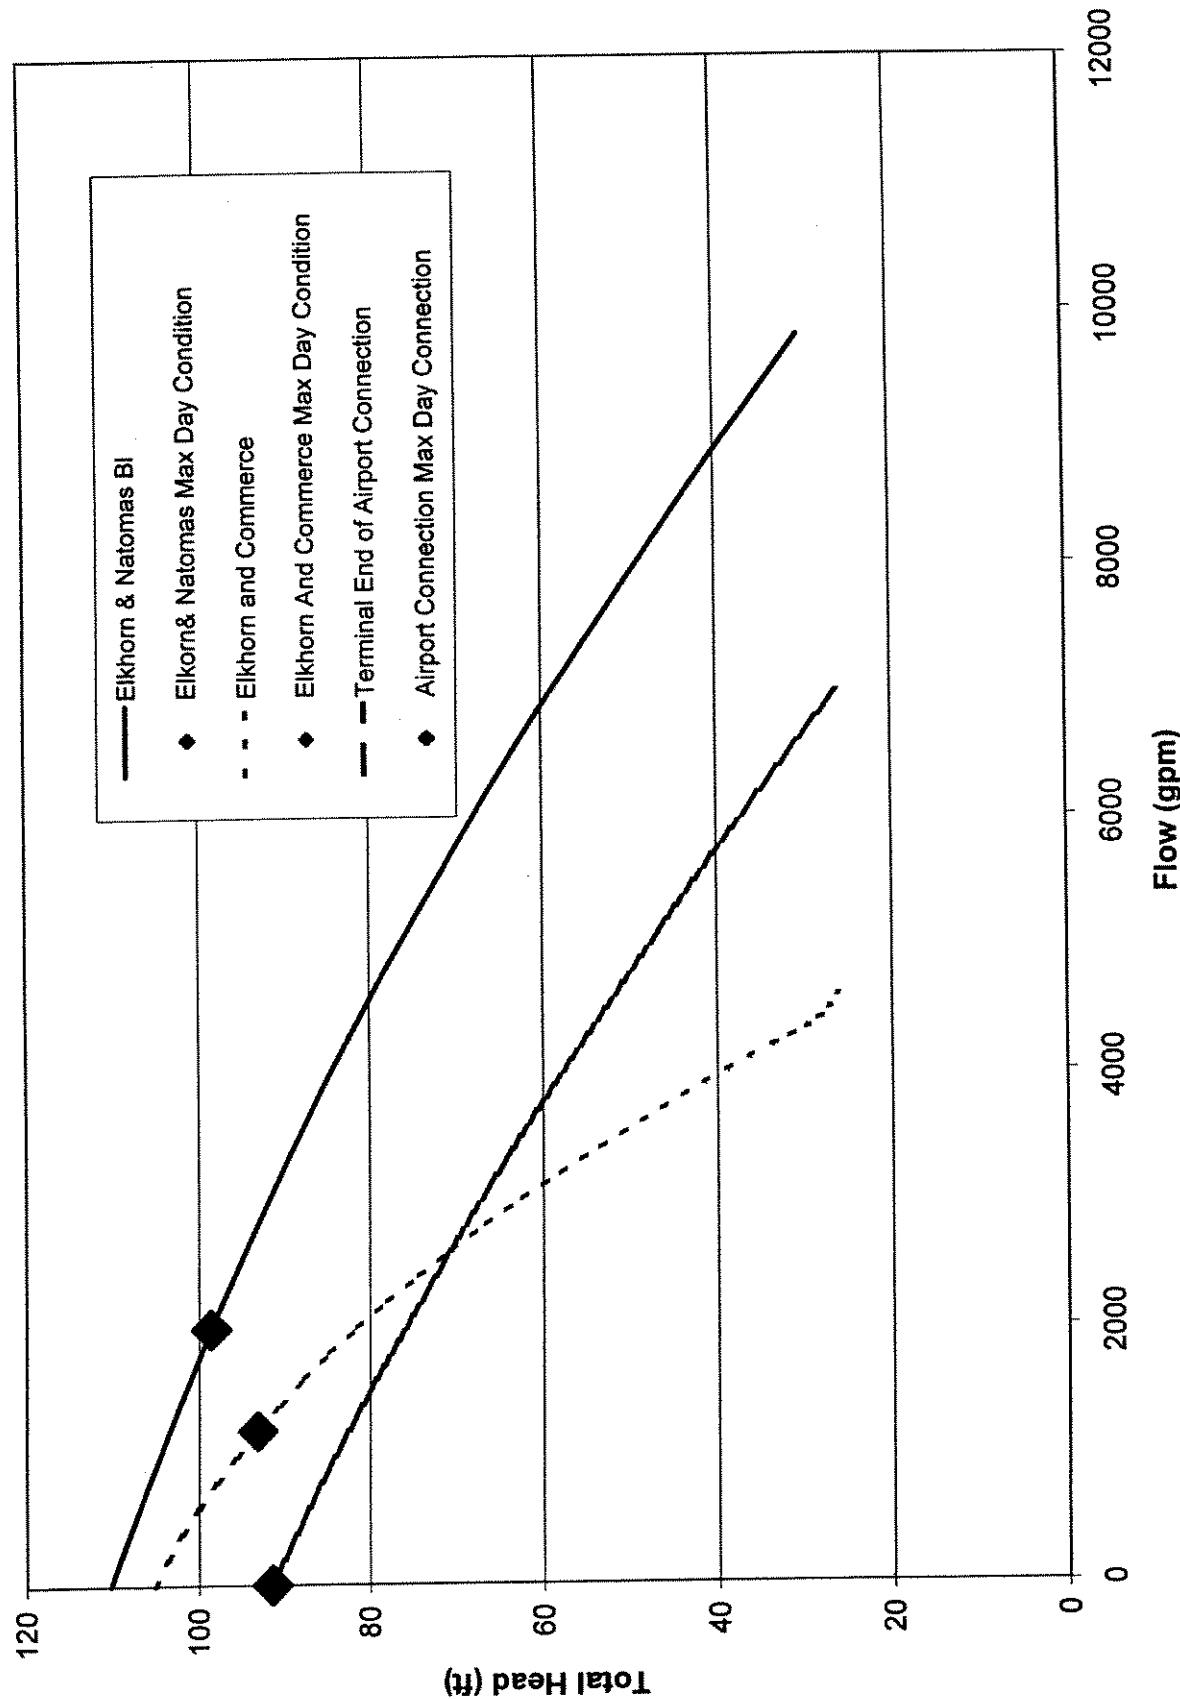

Wood Rogers is encouraged to review the conditions placed upon the proposed project. A new 24/30-inch transmission main traveling west from the existing 24-inch main at the corner of Natomas Bl and Elkhorn Bl will need to terminate at the 30-inch T-main currently being constructed to serve the Airport and Metro Air Park.

This analysis does not represent a verification of the proposed hydraulic model, rather it is the existing boundary conditions should such demands be placed upon the distribution system at proposed location.

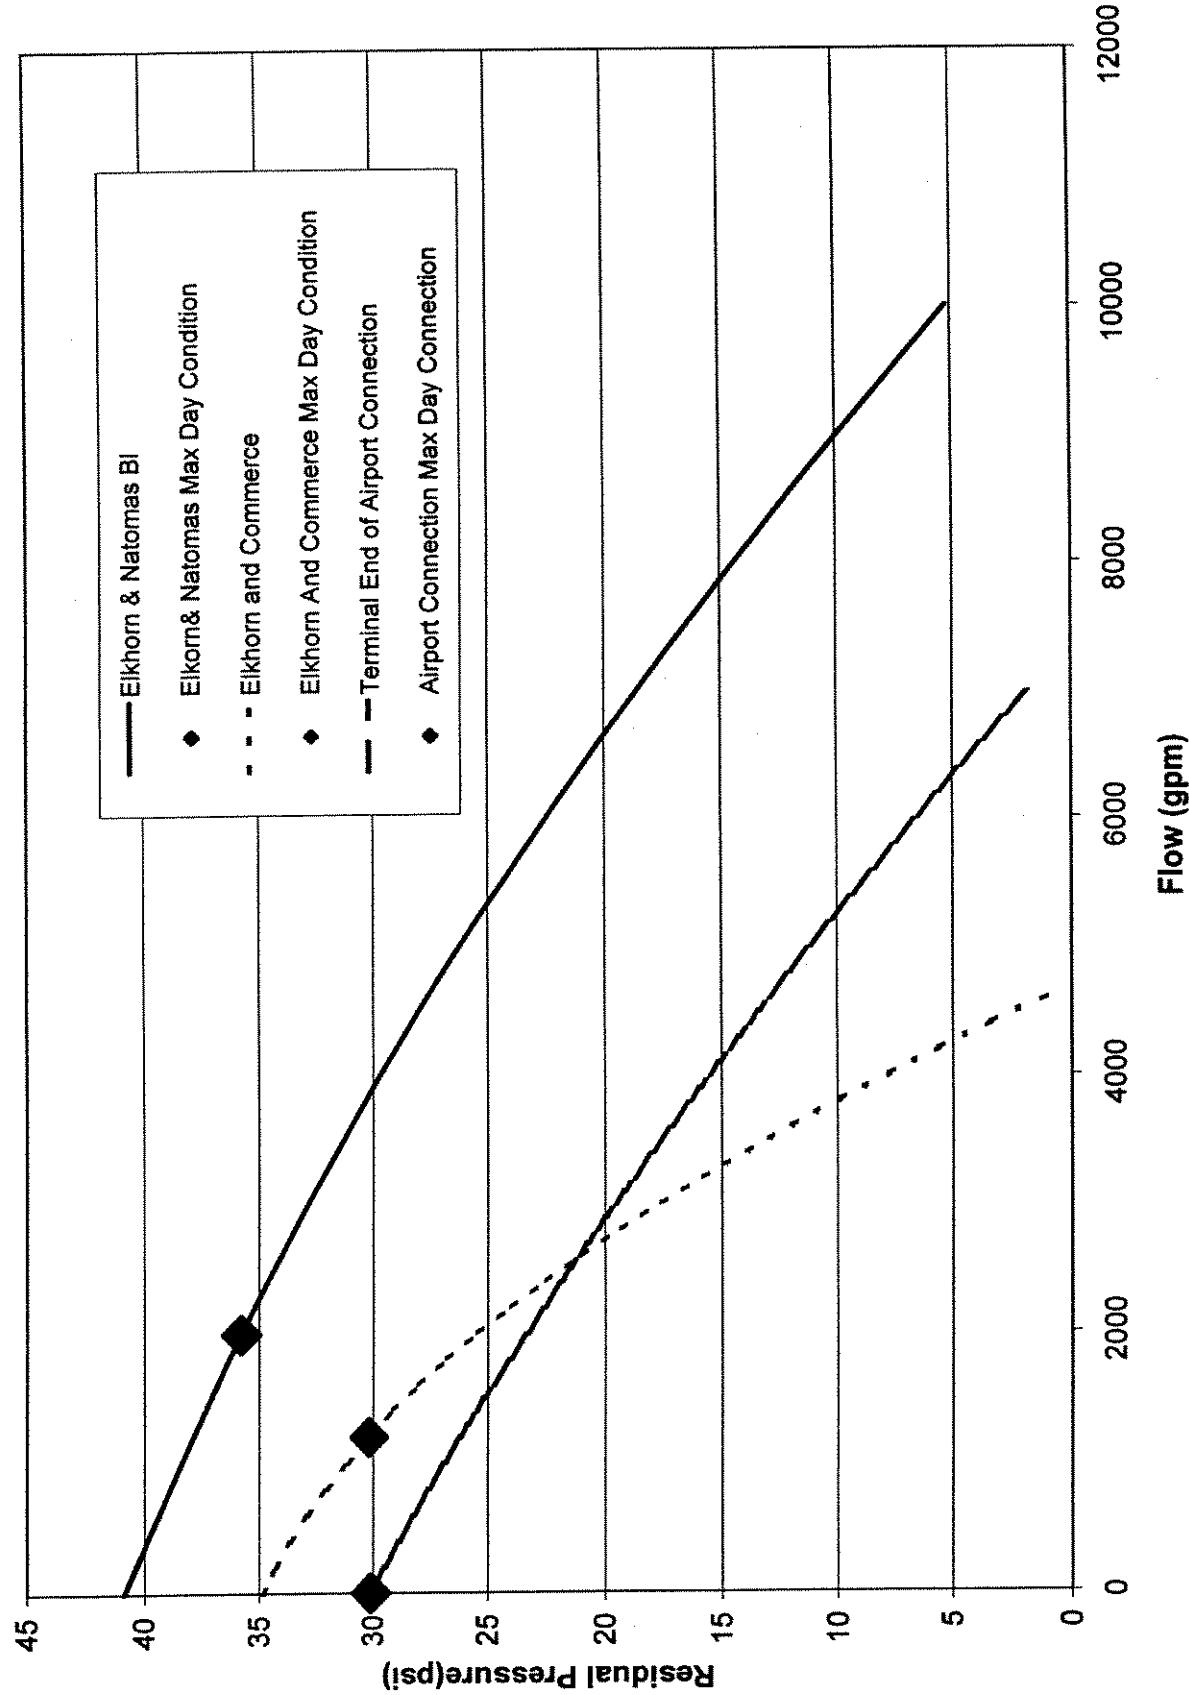

Should you have any further questions please do not hesitate to contact me at 808-1725.

The City does not certify or guarantee the accuracy or reliability of any information, data or modeling results set forth in this memorandum. Numerous factors, including unforeseen conditions and maintenance operations, may affect pressure conditions, and modeling results always should be verified by flow testing. By accepting a copy of this memorandum, any non-City user of this memorandum agrees to these conditions, and further agrees that the City of Sacramento will not be liable for any damages, costs, claims or other liability arising from any actions taken or omissions made in reliance on any information, data or results presented herein, nor will the City be liable for any other consequence arising from any such reliance.

Note: Boundary conditions for peak hour demands were derived from the maximum day demand boundary conditions at the recommendation of the City of Sacramento's Department of Utilities staff. Rating curves were increased by a constant head of 2.8 ft to account for booster pumps and to give a minimum residual pressure of 30 psi at the boundary points during peak hour demands.
